A <u>good</u> design:

We all know that sometimes we have too many tabs open on a single Chrome window, but we also need every single one of them. We may have multiple Chrome windows to sort them out but it only leads to a more messy desktop environment.

Chome lets you search for any open tabs that you have just by clicking on the button located in the top right corner of the screen and typing the name of the tab you would like to be displayed. A good aspect of this interface is that it is very descrite and doesn't take any valuable space on the screen. One can also use the keyboard shortcut Ctrl+Shift+A to use this feature. This allows for a faster and more reliable workflow.

A <u>bad</u> design:

A multiplug outlet is a socket to which you can connect more than one plug at the same time. It's usually used to connect chargers or power suppliers.

Most multiplugs have outlets that are very close to each other, which can be a real pain when you need to use many of them at the same time, since a lot of chargers are too big to fit next to each other, without risking damage by being pushed on the side.

A good solution is to use these types of outlets:

With this design each charger is clear of any damage caused by other chargers. Usually it even has USB plugs which can come in very handy.
